Product Requirements Document

A Founder-Led CRM for Early-Stage Startups

Version 1.0 | March 2026 | PRD: Problem Space + Solution Space

Based on primary research with 5 India-based founder personas and secondary market analysis across Folk, Pipedrive, Streak, and Clay CRM platforms.

1. Document Overview

Purpose

This document is the unified Product Requirements Document for **NoSheet** — a WhatsApp-first, AI-powered CRM built specifically for early-stage founders (0–20 employees) who personally handle sales. It synthesises the Problem Space analysis, Solution Space architecture, and MVP definition into a single reference.

Objective

To validate — using primary interviews with 5 India-based founder personas and secondary market analysis — that three failure modes drive revenue leakage in founder-led sales:

- Context Collapse: founders lose the thread of multi-channel conversations when no unified record exists.
- Administrative Debt: manual CRM logging is the first activity dropped when founders are busy.
- Post-Sale Blind Spot: every existing CRM ends at 'Closed Won', leaving retention untracked.

This document sets the stage for a solution that requires near-zero manual data entry, onboards in under 5 minutes, and lives where founders already work — primarily WhatsApp.

2. Problem Space — Business & User Perspective

2.1 Business POV: The Leaky Bucket

Early-stage startups suffer from a structural 'Leaky Bucket' problem. Founders are effective at generating initial interest through outbound and referrals, but the operational discipline required to close and retain deals is consistently neglected — not from lack of intent, but from lack of a tool designed for their context.

Revenue Leakage

30–40% of warm leads in a typical founder's pipeline never receive structured follow-up. This is not a motivation failure — it is a systems failure. When conversation history is spread across WhatsApp, Meta, Instagram DMs, and email, the cognitive overhead of reconstructing context before a follow-up exceeds the time founders are willing to spend. Leads go cold silently.

The No-Decision Problem

A large-scale study of over 2.5 million recorded sales conversations found that 40–60% of deals end with a prospect who expressed purchase intent but never acted — lost not to a competitor but to inaction. [Harvard Business Review] Structured, persistent follow-up is the tractable product intervention. This is a recoverable problem.

Scalability Debt

The absence of a centralized record creates a compounding liability. When founders hire their first salesperson, brief an investor on pipeline health, or simply hand off a warm lead, there is no structured data to transfer. Organizational memory is locked in the founder's phone and head — resulting in near-complete loss of context at scale inflection points.

2.2 User (Founder) POV

Cognitive Overload

Our primary research found founders managing simultaneous conversations across WhatsApp, Meta ads, Instagram DMs, Gmail, and in some cases LinkedIn — with no single record tying these together. The case study baseline identifies 50–150 active conversations across 4–6 communication channels as the typical operating context.

Context Collapse

Moving from a Meta ad lead to a WhatsApp conversation to an email proposal causes the founder to lose the 'thread' of the deal. Without a structured record, every follow-up starts with the founder mentally reconstructing what was last said, what was promised, and what the prospect's actual pain is. This reconstruction cost is the primary driver of follow-up abandonment.

Admin vs. Closing

"HubSpot feels like a second job. I want to close, not be a data entry clerk."
— Practitioner — Secondary Research

To a founder, 'sales' means the conversation. Updating a CRM is administrative work that delivers no immediate value. Founders already spend approximately 70% of their time in active conversations. The remaining 30% is stretched across product, operations, hiring, and investor relations — leaving zero bandwidth for system maintenance.

2.3 Market Size

Segment	Size	Source
Global SMBs	150M+	Limelightdigital / DemandSage
Active startups — US	~1.14M	DemandSage
Active startups — India	621,000+	DemandSage
B2B high-growth startups (SAM)	~1.2M	Estimated from above
Global CRM market (2032 projection)	\$262B at 12.6% CAGR	Secondary Research
VC into AI-native CRM (2024–25)	\$500M+	Secondary Research

The CRM adoption gap is well-documented: 91% of businesses with 11 or more employees use a CRM, compared to only 50% of those with 10 or fewer — a 40-percentage-point gap where the non-adopting half falls almost entirely within NoSheet's target segment. [Breakcold, SellersCommerce] India is a particularly compelling primary market: Bengaluru-Karnataka entered the Top 20 Global Startup Ecosystems in 2025 for the first time. [Startup Genome GSER 2025]

2.4 Constraints

Technical

- WhatsApp and LinkedIn both operate restricted API environments. Deep native integration requires WhatsApp Business API costs; LinkedIn DM capture requires browser extension architecture (folkX model) or manual entry. These are real architectural constraints that no current lightweight CRM has fully resolved.

- Instagram DM API access is available via Meta's Graph API but requires business verification and has rate limits.

Business

- Founders in the target segment are acutely price-sensitive. They reject per-contact pricing (which punishes pipeline growth), setup fees, and tools requiring external consultants to configure. [Primary Research — Gnanesh, Daman]
- Founders will not invest 15+ days learning a new tool. Gnanesh's team required 15 days to reach basic competency with Zoho and no team member reached expert level.

Regulatory / Compliance

- Capturing WhatsApp messages and DMs involves private communications. Strict adherence to GDPR and applicable data privacy standards is required before any auto-capture feature can be launched. All channel integrations require explicit opt-in — no passive capture.

2.5 Explicitly Out of Scope

- Marketing Automation — focus is the sales cycle from first contact through close and early retention, not top-of-funnel lead generation or drip campaigns.
- Enterprise Features — complex team hierarchies, multi-currency reporting, and granular permission sets.
- High-Volume Cold Calling — auto-dialers or cold-calling infrastructure.

3. Background: The Founder's Sales Cycle

3.1 What Has Changed

Ten years ago, B2B sales happened primarily over email and phone. Today, the dominant channels for early-stage India-based founders are WhatsApp + Meta/Instagram (for D2C and service businesses) and LinkedIn (for B2B), with email used primarily for proposals and formalisation. This fragmentation is not a preference — it is a structural shift in where buyers respond.

- WhatsApp is the primary closing and relationship channel for India-based founders — used by every persona in our primary research cohort.
- Meta/Instagram is the primary lead source for D2C and service businesses.
- LinkedIn is cited as a source of friction in secondary research (Reddit/practitioner data) but was not the primary pain channel in any primary research interview. For the India-first segment, WhatsApp + Meta is the higher-priority channel pair.
- Email auto-syncs into most CRMs but is increasingly the last channel a prospect responds on.

3.2 Current State vs. Desired State

Dimension	Current State	Desired State
Where leads live	Fragmented: WhatsApp, Meta, Instagram, Excel, memory	One unified timeline per contact
Follow-up tracking	Memory or WhatsApp labels	Automated reminders with deal context

CRM data entry	Manual copy-paste, often skipped entirely	Auto-capture from conversation channels
After-sale support	CRM ends at 'Closed Won'	Post-sale retention tracking built in
Onboarding time	15 days just to reach basic competency (Zoho)	< 1 day to first value

4. Discovery — Primary Research

4.1 Methodology

In-depth qualitative interviews and behavioral profiling were conducted with 5 founder personas across different industries, business models, and sales complexity levels. All 5 are India-based, early-stage, and personally handle sales.

4.2 Personas at a Glance

Persona	Industry	Core Pain	Primary Channel	CRM Status
Gnanesh	Fintech / BD	Setup cost, retention tracking, team handoffs	WhatsApp + Zoho	Zoho — abandoned key features due to add-on pricing
Daman	D2C Cricket Bats	Missed follow-ups, fragmented Meta/WhatsApp context	WhatsApp + Meta	None — pure 'jugaad' (memory + Python script + WA labels)
Shreya	AI Fashion App	User behavior visibility, feedback organisation	App + Email	No CRM — tracks via Google Sheets manually
Legal Nextt	Legal Services	Follow-ups, in-system comms, forecasting	WhatsApp + Email	Google Sheets + manual WhatsApp
Agency	Digital Marketing	Missed follow-ups, churn, long-cycle nurturing	WhatsApp + Email	Google Sheets + WhatsApp labels

4.3 Detailed Persona Insights

Persona 1 — Gnanesh (Fintech / Affiliate Marketing)

Metric	Value
Peak daily leads	~300 leads/day
Conversion cycle	1.5 days (fastest) to 45 days (complex)
CRM training time	15 days to basic competency with Zoho; nobody reached expert level

Team on CRM	5–6 people on a single board — led to major context-sharing failures
-------------	--

"You connect to your email, that's an add-on. You make a call, that's an add-on. There's session recording, it's an add-on. For me, it would predict the billing. That was a major concern."

— Gnanesh

"The major issue is not onboarding the customer, it's maintaining the customer. After-sales support is a bigger headache."

— Gnanesh

Key insight: Gnanesh's most differentiated finding is that retention is harder than acquisition. Current CRM workflows end at 'Closed Won'; founders have no tool to track post-sale health, support requests, or re-engagement triggers.

Persona 2 — Daman (D2C Sports Equipment / Cricket Bats) — Primary Persona

Metric	Value
Total customers	~100 (built over 1 year)
Deals closed/month	15
Average deal cycle	15 days from first touch to close
Conversion rate	3%
Lead channel split	60% Performance Marketing (Meta), 40% Cold Outreach
Current 'CRM'	Memory + Facebook CRM + WhatsApp Business Labels + Custom Python script for Instagram ID extraction

"No tool, all jugaad."

— Daman

"For me it wasn't an issue because of the memory I have — but we chatted with everyone."

— Daman (acknowledging the system breaks at scale)

Key insight: Daman represents the 'too big for memory, too small for CRM' inflection point. His DIY Python script to extract Instagram IDs signals high intent and low tool satisfaction. He admits to losing deals from missed follow-ups but has no replacement system.

Persona 3 — Shreya (AI Fashion App — Wardo)

Pre-revenue, 2–3 person team. Primary need is user behavior visibility ('I'd want to see on my dashboard how people are behaving with my app') — closer to product analytics than sales CRM. All conversations fragmented across Instagram DMs, LinkedIn, WhatsApp, and email. No centralized system.

CRM relevance: unified inbox for DMs, waitlist-to-user journey tracking, and feedback tagging are the features most applicable to this persona.

Persona 4 — Legal Nextt (Legal Services Sales Consultant)

25–30 employee company. Sales consultant handles outreach manually via Google Sheets. Core pains: no in-system WhatsApp/SMS communication (must dial every time), no structured plan recommendation, no version control on prior customer discussions, no clarity on monthly forecast.

Sales journey: lead purchase from 3rd party → reach out → follow-up → WhatsApp payment link → follow-up for payment → manually add customer email to platform. Each step is manual with no system linking them.

Persona 5 — Digital Marketing Agency (2-person B2B)

5 years old, ~20 customers (10 domestic, 10 international APAC). ~5–7 active leads at any time. Single Google Sheets with tabs per stage. Highest conversion channel: 1:1 calls and founder referrals. Key pain: customer decline observed due to delivery team gaps and relationship-building failures — the CRM doesn't support post-sale health.

4.4 Cross-Persona Consolidated Insights

1. WhatsApp is the primary sales channel, not an afterthought. Every founder in the cohort relies on WhatsApp as the core communication layer. Any CRM that doesn't natively capture or integrate WhatsApp is immediately abandoned.
2. Memory-based tracking is a time bomb. Daman's setup works at 100 customers because of strong founder memory. The founder explicitly acknowledges this breaks at scale. The product opportunity is bridging 'founder memory' to 'system memory' with zero additional effort.
3. CRMs end at 'Closed Won' — but the pain continues after. Gnanesh's experience shows retention and after-sales support are harder problems than acquisition. No existing lightweight CRM tracks post-sale health.
4. Pricing unpredictability destroys trust. Gnanesh's Zoho experience — where email sync, call logging, and session recording each required separate paid add-ons — created budgeting anxiety that damaged the tool relationship. Founders need flat, predictable pricing.
5. 15 days is the hidden onboarding cost. Gnanesh's team took 15 days to reach basic Zoho competency. A 2-person team cannot absorb this. Any new tool must deliver first value in under 1 day.

5. Discovery — Secondary Research

5.1 Follow-Up Behavior (The Structural Gap)

Finding	Data Point	Source
Sales requiring 5–12 follow-up attempts to close	80% of sales	SPOTIO
Founders / reps who give up after one attempt	44%	SPOTIO
Sales closed on first contact	2% only	Martal Group
Deals lost to 'no decision' (not competitor)	60%	Saleslion
Prospects expressing intent but not acting (2.5M conv. study)	40–60%	Harvard Business Review

This is not a motivation problem — it is a systems problem. Founders lose the thread of a conversation and give up rather than follow up with no context. The data confirms that the majority of 'lost' deals are recoverable with structured, persistent follow-up.

5.2 CRM Adoption & Failure

Finding	Data Point	Source
Businesses with 11+ employees using a CRM	91%	Breakcold, SellersCommerce
Businesses with 10 or fewer employees using a CRM	50%	Breakcold, SellersCommerce
CRM implementations that fail	20–70%	DemandSage, Vantagepoint
CRM failures attributed to adoption / people issues	60%+	DemandSage

The 20–70% CRM failure rate confirms that the product design challenge is primarily behavioral, not technical. The tool must earn adoption by delivering immediate value — not by demanding it through data entry.

5.3 Channel Reality (India-First Markets)

- WhatsApp achieves significantly higher response rates than email in India-first markets. However, no lightweight CRM natively captures WhatsApp message history into a contact timeline without requiring the WhatsApp Business API (enterprise pricing). This gap is universal across all four CRMs analyzed. [Competitor Review Analysis — G2, Capterra, Trustpilot, Product Hunt]
- Meta/Instagram is the primary lead generation channel for D2C founders in the primary research cohort, yet is completely unaddressed by every competing product.
- LinkedIn manual entry was identified as a significant friction point in Reddit-sourced practitioner data — but was not the primary pain channel for any of the 5 founders interviewed. For the India-first segment, WhatsApp + Meta is the higher-priority channel gap.

6. Competitor & Gap Analysis

6.1 Why Each Competitor Fails This Segment

Tool	Core Failure for Early-Stage Founders
HubSpot	Setup illusion: basic config takes 10 minutes, but custom deal stages require \$1,000+ tiers. Mobile app is largely read-only. Teams under 50 are deprioritized to community forums. Feels like a marketing tool that added sales later.
Zoho	Requires technical knowledge most small teams lack — 15 days to basic competency (Gnanesh). Every essential feature (email, calls, recordings) is a separate paid add-on, making costs unpredictable. 'Deluge' scripting language required for advanced automation.

Pipedrive	Removed WhatsApp integration for new customers in August 2023, fully discontinued February 2024. No native LinkedIn integration. Features gated behind escalating price tiers. Community forum shut down July 2025.
Folk	No workflow automation at lower tiers. No mobile app at all. Deal management locked behind a paywall that doubles the monthly cost.
Streak	Gmail-only — no support for founders who don't work primarily in email. No WhatsApp, LinkedIn DM, or Instagram capture. Free plan removed March 2024; minimum jumped to \$49/user/month. Development reportedly stalled.
Facebook CRM	Zero customization: 'No customisation inside Meta CRM, have to use jugaad always.' [Daman, Primary Research]
Google Sheets / Notion	Default workaround — offers familiarity but no automation, no follow-up engine, no unified timeline. Breaks as soon as volume exceeds ~30 active leads.

6.2 Feature Gap Matrix

Capability	HubSpot	Pipedrive	Folk	Streak	The Gap
Auto-Email Capture	✓ Native	✓ Native	✓ Native	✓ Gmail only	Standardised — but email is declining channel
WhatsApp Capture	~ Business API	✗ Discontinued	✗	✗	The Black Hole — no lightweight CRM solves this
Meta/Instagram Capture	✗	✗	✗	✗	Completely unaddressed
LinkedIn Capture	✗ SalesNav	✗ Manual	✓ Chrome ext.	✗	High friction for all; less critical for India-first
Mobile-First UX	~ Read-only	~ Partial	✗ No app	✗ Unusable	Critical gap — founders are mobile-first
Post-Sale Retention	~ Paid tier	✗	✗	✗	Entirely missing in all tools
Cross-Channel Follow-Up	✗	✗	✗	✗	Universal gap
Flat Predictable Pricing	✗ Add-ons	✗ Tier-gated	~ Limited	✗ Bait-switch	Major founder trust issue

6.3 Cross-Product Pain Point Intensity

Pain Point	Folk	Pipedrive	Streak	Clay	Universal?
Multi-channel gap (WA/LinkedIn)	High	High	High	Med	Yes
Manual data entry burden	High	High	High	Med	Yes
Pricing / value frustration	Med	High	High	High	Yes
Automation limitations	High	High	High	Med	Yes
Mobile app deficiency	High	Med	High	Med	Yes
Follow-up / reminder gaps	Med	Med	Med	Low	Yes

7. Pain Point Priority Map (Kano Framework)

The following prioritisation was derived from the 5 primary research interviews. Each feature area is placed in a Kano 2×2 matrix by plotting Importance to the founder (y-axis) against the Satisfaction gain if solved (x-axis). Features in the top-right quadrant — High Importance, High Satisfaction — define the MVP build list.

Kano 2×2 Priority Matrix

	← Low Satisfaction if Solved	High Satisfaction if Solved →
↑ HIGH IMPORTANCE	- Retention & after-sales support workflows (post-sale tracking, issue follow-ups) - Incentive/behaviour alignment — sales focus on new vs. retain - Forecasting reliability — month-end pipeline confidence - Customer success / delivery capability gaps	- Follow-up engine (next action, reminders, overdue list, payment follow-ups) — ALL 5 personas - Single source of truth — unified customer timeline/profile — ALL 5 personas - WhatsApp-first capture — auto-log, reduce manual entry — G, D, L, A - Simple pipeline + stage progression (clear movement, templates) — G, L, A, D - Ownership + handoffs (assign owner, activity log, internal notes) — G, L, A
LOW IMPORTANCE ↓	- Enterprise-grade customisation (custom objects, complex workflows) - Advanced admin controls (granular permissions, audit trails) - Multi-branch hierarchy management (regional rollups) - Feature-completeness bloat (everything-for-everyone CRM)	- AI summaries + auto-field fill (magic but not essential Day 1) - Dormant lead detection + smart nudges - Beautiful advanced dashboards - One-click setup templates & onboarding wizards

Persona key: G = Gnanesh | D = Daman | S = Shreya | L = Legal Nextt | A = Agency

Quadrant Descriptions

Quadrant	Build Guidance
 Build First	High Importance + High Satisfaction — Core MVP features. Solving these creates immediate measurable value and drives retention. Every day without them costs a deal.
 Phase 2	High Importance + Low Satisfaction — Structural constraints or people/process problems. Important, but a product feature alone won't fully solve them. Acknowledge; don't over-invest in MVP.
 Post-MVP Delight	Low Importance + High Satisfaction — 'Nice to have' features. Delightful if present, but absence does not block adoption. Layer in after core retention is proven.
 Do Not Build	Low Importance + Low Satisfaction — Feature bloat. Building these diverts engineering from the core and increases cognitive load for the user without proportional return.

7.1 Feature Priority Order

Based on the Kano analysis above, the five core features are sequenced below in build priority order. Priority reflects the combination of: (1) research-validated importance across the most personas, (2) degree of differentiation vs. existing tools, and (3) dependency relationships — features higher in the list unblock features below them.

Prio rity	Feature	Core Pain It Solves	Personas Affected
#1	Channel Integration Hub	Founders use 3–5 fragmented tools with no unified record. Every channel captures data in isolation. This feature is the foundation everything else depends on.	All 5 personas
#2	Reminder & Follow-Up Engine	44% of founders abandon follow-up after one attempt. Deals are lost not to competitors but to silence. This engine eliminates the manual burden of tracking who needs a nudge.	All 5 personas
#3	Call/Meeting Recording + Auto-Summarisation	Founders lose call context the moment they hang up. Key commitments, pain points, and next steps are lost to memory. Auto-summarisation feeds the deal card without any logging effort.	Gnanesh, Daman, Legal Nextt, Agency
#4	WhatsApp AI Sales Agent: The 'Commander' Interface	Founders are mobile-first and WhatsApp-native. Querying a separate CRM app creates the exact friction this product is designed to eliminate. The Agent brings the CRM into WhatsApp itself.	All 5 personas
#5	AI-Structured Deal Cards	Without structured deal cards, pipeline visibility is impossible. Deal Cards are the output layer that	All 5 personas

	surfaces the value of Features 1–4 in an organised, scannable format.	
--	---	--

Note: Features 1 and 2 have detailed end-to-end flows documented in Section 12 (Feature Architecture). Features 3–5 are fully described in their respective feature sections.

8. Narrowed Problem Statement

"Early-stage founders (1–20 employees) lose warm leads and stall after-sale relationships because they cannot unify sales context from WhatsApp, Meta/Instagram, and Email into one frictionless timeline — causing missed follow-ups, context collapse when conversations resume, and zero post-sale visibility."

Validated by:

- All 5 primary research personas rely on memory or WhatsApp labels for tracking — no unified record exists.
- 44% of salespeople abandon follow-up after one attempt because the thread is lost. [SPOTIO — spotio.com/blog/sales-statistics]
- 60% of deals are lost to 'no decision' — a recoverable problem with structured follow-up. [Saleslion — saleslion.io]
- No current lightweight CRM natively captures WhatsApp or Meta/Instagram conversations. [Secondary Research — Competitor Analysis]

9. Primary User Persona

Primary Persona: Daman — 'Too Big for Memory, Too Small for CRM'

Attribute	Detail
Name	Daman
Role	Co-Founder — handles all sales personally
Industry	D2C Sports Equipment (Cricket Bats)
Team size	2 (both founders)
Active customers	~100
Deals closed/month	15

Average deal cycle	15 days
Lead channels	60% Meta/Performance Marketing, 40% Cold Outreach
Conversion rate	3%
Current 'CRM'	Memory + Facebook CRM + WhatsApp Business Labels + Custom Python script

Why Daman is the Primary Persona: Daman represents the segment at its most critical inflection point — functional enough at current scale not to feel urgent pain, but structurally broken the moment volume increases or a co-founder leaves. His DIY Python script to extract Instagram IDs signals high intent and low tool satisfaction. He loses deals from missed follow-ups, acknowledges it, and has no replacement.

- Goals: Close more deals with less mental overhead. Stop losing leads to forgotten follow-ups.
- Frustrations: No CRM fits without forcing him into a workflow designed for someone else's business. Facebook CRM has zero customisation. WhatsApp labels work but don't remind him. Memory is a single point of failure.
- Adoption trigger: When he misses a follow-up that costs him a deal he should have closed.

"No tool, all jugaad."
— Daman

Supporting Persona: Legal Nextt — 'The Consultant Who Needs Process'

25-person team, sales consultant model. Validates the same core feature set as Daman but adds pipeline visibility and team handoff requirements. Pains concentrated in: follow-ups, communication from within the system, plan recommendation consistency, and month-end forecasting.

10. Key Metrics to Improve

Metrics are directly linked to the Feature Priority Order established in Section 7.1. Each metric traces back to a validated pain point from primary research and maps to the feature designed to address it.

Metric	Current State	Target State	Source	Feature Priority
Tools used per founder	3–5 fragmented tools	1 unified view	Primary Research — Daman, Agency	#1 Channel Integration Hub
Steps to log one interaction	5–7 manual steps (copy-paste across tools)	0 (auto-capture)	Primary + Secondary Research	#1 Channel Integration Hub
CRM onboarding time	15 days to basic competency (Zoho)	< 1 day to first value	Primary Research — Gnanesh	#1 Channel Integration Hub

Follow-up abandonment rate	44% give up after 1 attempt	Automated reminders + overdue queue	SPOTIO	#2 Reminder & Follow-Up Engine
Deals lost to no-decision	60% of pipeline lost to inaction	Reduced via persistent structured follow-up	HBR, Saleslion	#2 Reminder & Follow-Up Engine
Meeting insights captured	0 — all call notes are mental	100% of recorded calls auto-summarised to deal card	Primary Research — All personas	#3 Call/Meeting Recording
Time to access pipeline status	Open laptop, navigate to CRM dashboard	< 10 seconds via WhatsApp message	Primary Research — Daman, Agency	#4 WhatsApp AI Sales Agent
Post-sale visibility	Zero — CRM ends at Closed Won	Active retention tracking on deal card	Primary Research — Gnanesh	#5 AI-Structured Deal Cards

11. Solution Space — NoSheheet

11.1 Product Concept

NoSheheet is a WhatsApp-first, AI-powered CRM that auto-captures conversations across channels, organises deals without manual entry, and nudges founders on next actions — so they never drop a warm lead again.

Core Philosophy: The CRM updates itself. The founder just sells.

11.2 The Four Questions NoSheheet Answers

#	Question	How NoSheheet Answers It
1	Who should I follow up with today?	AI-generated daily action list, sorted by urgency and deal stage
2	What was the last thing I said to [Name]?	Unified contact timeline — all channels, chronological, searchable
3	Where is my pipeline right now?	Dashboard accessible via web or WhatsApp message ('pipeline')
4	Which deals are about to go cold?	Colour-coded heat map of deal activity; automatic cold-lead alerts

11.3 Design Principles

- Zero-friction first: the tool must deliver value before asking for effort. No form to fill before first use.

- WhatsApp-native: reminders, queries, and pipeline checks delivered via WhatsApp — not another app to open.
- AI suggests, founder confirms: fully automatic AI actions break trust on Day 1. Confirm-to-accept maintains control while keeping effort near zero.
- Progressive disclosure: show only what's relevant to the current deal stage. Hide empty fields. Surface prompts only when useful.
- Flat pricing: no per-contact charges, no add-on billing. One predictable monthly fee.

12. Feature Architecture

Feature 1 — Channel Integration Hub

Connects Gmail, WhatsApp Business, Google Calendar, and (in later versions) LinkedIn DMs, Instagram DMs, and Outlook into a single ingestion layer. Every message, call, and meeting across channels is automatically captured, tagged to the correct contact, and timestamped.

Rule	Logic
Auto-tag to contact	If sender email/phone matches an existing contact → attach to that contact's timeline. If no match → create 'Untagged Lead' with source channel noted.
Channel priority	If a contact has conversations across 3+ channels → show the channel with most recent activity as 'Primary Channel' on the deal card.
Duplicate detection	If same person messages from email AND WhatsApp → surface 'Confirm Merge' prompt. Never auto-merge silently.
Calendar sync	Pull all meetings from Google Calendar. If a meeting has an external attendee matching a contact → auto-link to that deal.
Sheets/Notion import	On first setup, import existing lead data from connected Notion databases or Google Sheets. AI maps columns to CRM fields. One-time import in MVP; live sync in v2.

MVP scope: Gmail + WhatsApp Business + Google Calendar. LinkedIn DMs and Instagram DMs deferred to v2 due to API complexity and TOS risk.

⚙ Detailed Flow: Channel Integration Hub (Priority #1)

This flow covers every step from a message arriving on any connected channel through to it appearing correctly on a founder's contact timeline — with zero manual action required.

Flow A — Incoming Message (WhatsApp or Gmail)

Step	Actor	Action / System Behaviour	Output
1	Lead	Sends a WhatsApp message or email to the founder	Message arrives on native app
2	NoSheet (Channel Listener)	Webhook / API polling detects the new message on the connected channel within 30 seconds	Raw message object captured
3	Contact Matching Engine	Extract sender identifier (phone number for WA; email address for Gmail). Query contact database for match.	Match result: Found / Not Found
4a	System (Match Found)	Attach message to existing contact's timeline. Update 'Last Activity' timestamp. Recalculate 'Who Owns Next Move'.	Timeline updated. Reminder cadence reset.
4b	System (No Match)	Create new 'Untagged Lead' entry. Tag source channel (WhatsApp / Gmail / Calendar). Set stage to 'Discovery' by default.	New contact card created. WhatsApp alert: 'New lead from [channel]: [Name/number]'
5	AI Summariser	Generate or refresh the 2–3 sentence conversation summary on the deal card. Extract any new pain points, commitments, or urgency signals from the message content.	Deal card 'Last Conversation Summary' updated
6	Reminder Engine	If incoming message = lead reply after founder outreach → reset outbound follow-up timer. If incoming = new inbound from founder → start inbound response timer (4-hour window).	Reminder cadence adjusted
7	Founder	Receives WhatsApp notification (if configured): 'New message from [Name] — [1-line preview]'. No action required to log. Data is already in the system.	Founder informed; no manual entry needed

Flow B — New Lead via Calendar Invite

Step	Actor	Action / System Behaviour	Output
1	Google Calendar	New calendar event created with an external attendee email address	Event data available via Calendar API
2	Calendar Listener	NoSheet detects event via Google Calendar webhook. Extract attendee email(s).	Attendee list extracted
3	Contact Matching Engine	Match each external attendee against existing contacts by email.	Match result per attendee
4a	System (Match Found)	Link calendar event to matched deal. Add meeting entry to contact's timeline: date, time, event title. Set pre-meeting brief reminder.	Deal card updated. 1-day and 1-hour pre-brief scheduled.

4b	System (No Match)	Create new contact from attendee name + email. Stage = Discovery. Source = 'Calendar — Inbound'. Founder alerted.	New contact card. WhatsApp alert to founder.
5	Reminder Engine	Schedule pre-meeting brief delivery: T-24h and T-1h before event. Brief includes: contact name, company, deal stage, last conversation summary, AI-suggested meeting goal.	Pre-brief scheduled in reminder queue

Flow C — Duplicate Detection

Step	Actor	Action / System Behaviour	Output
1	System	Incoming WhatsApp message from phone number +91-XXXXXXX. Separately, Gmail contact exists for the same name with a different email.	Potential duplicate detected
2	Duplicate Detector	Match heuristics run: same display name + company domain + message content similarity > 80%. Confidence score calculated.	Merge candidate surfaced
3	NoSheheet → Founder	WhatsApp message: 'Possible duplicate: [Name A] (WhatsApp) and [Name B] (Gmail) may be the same person. Merge?' → [Yes, Merge] [No, Keep Separate]	Founder decides. System never auto-merges.
4a	System (Merge)	Combine both records into one contact card. Unified timeline shows all messages from both channels in chronological order.	Single contact card with full cross-channel history
4b	System (Keep Separate)	Records remain separate. Duplicate flag cleared. System won't re-prompt for this pair.	Two distinct contact records maintained

For every contact/deal, NoSheheet maintains a living deal card that auto-populates from conversations. The card is structured across 5 sections:

Section	Fields	Auto or Manual?
Who + How to Reach	Name, email, phone, company, role, LinkedIn URL	Auto-extracted from email signature / WhatsApp; editable
Where Are We?	Deal stage, expected close date, deal value	Stage: AI-suggested based on conversation keywords → founder confirms. Date/value: manual with AI prompt.
Last Touch + Next Step	Last conversation date, AI summary, next action, due date, who owns next move	Fully auto-updated after every new message or call. Regenerated each time.
Why They'll Buy	Pain point, decision-maker status, current solution/competitor, timeline urgency	AI-extracted from conversation text; founder confirms or edits.
How They Found You	Source channel, date of first contact	Auto-detected from ingestion channel. Default: 'Unknown'.

Deal stage auto-suggestion logic: AI detects keywords ('pricing', 'proposal', 'let's go', 'signed') in any conversation and sends a WhatsApp confirmation prompt to the founder before updating the stage.

Feature 2 — Reminder & Follow-Up Engine

Core principle: Founders don't set reminders. The AI sets them automatically based on conversation recency, deal stage, and response patterns. Founders only override when needed.

Trigger	Reminder Schedule	Channel
You sent message, no reply	Day 3 → Day 7 → Day 14 → Day 30 (then mark 'Gone Cold')	WhatsApp push
They replied, you haven't responded	4 hours → 24 hours → 'You're leaving [Name] hanging'	WhatsApp push
Demo scheduled	1 day before: deal card summary. 1 hour before: meeting context brief	WhatsApp push
Post-demo, no follow-up sent	Day 1: 'Send [Name] a follow-up?' Day 3: escalation	WhatsApp push
Proposal stage, no activity (5 days)	Day 5: check-in prompt. Day 10: 'Deal may be going cold'	WhatsApp push
Deal silent 30+ days	Auto-move to Cold bucket. Final prompt: 'Archive or try one more?'	WhatsApp push

Snooze rules: founder can snooze any reminder for 1 day, 3 days, or 1 week. After 3 snoozes on the same deal, AI asks: 'Should I archive this lead?' Vacation mode pauses all reminders and sends a prioritised catch-up digest on return.

⚙ Detailed Flow: Reminder & Follow-Up Engine (Priority #2)

This flow covers how the engine observes conversation signals, calculates the correct reminder timing per deal stage, delivers the reminder through WhatsApp, and handles every possible founder response — including snooze, done, and archive.

Flow A — Outbound Message Sent, No Reply Received

St ep	Actor	Action / System Behaviour	Output
1	Channel Listener	Detects that the founder has sent a message/email to a contact and the contact has not replied within 3 days.	Trigger: Day 3 follow-up queued
2	Reminder Engine	Generates context-aware reminder message: includes contact name, deal stage, last message sent (1-line AI summary), and a suggested follow-up action.	WhatsApp message drafted

3	NoSheet → Founder	WhatsApp: 'No reply from [Name] (Proposal stage). Last sent: [summary]. Follow up today?' → [Yes] [Remind in 3 days] [Mark Cold]	Awaiting founder response
4a	Founder replies: Yes	Reminder marked complete for this cycle. Next reminder automatically set for Day 7 if no reply still received. Optional: NoSheet sends a suggested message template the founder can copy.	Day 7 reminder queued
4b	Founder replies: Remind in 3 days	Snooze recorded. Counter incremented (3 snoozes max). Reminder rescheduled 3 days forward from today.	Reminder snoozed. Day counter paused.
4c	Founder replies: Mark Cold	Deal stage updated to 'Cold'. Contact moved to cold pipeline bucket. No further automated reminders unless founder reactivates.	Deal archived to Cold
5	Reminder Engine (Day 7)	If still no reply from contact: escalated reminder with suggested alternative approach message. 'Still no reply — try a different angle?'	Escalated WhatsApp reminder
6	Reminder Engine (Day 14)	Warning-level reminder: 'This deal may be slipping. [Name] hasn't replied in 14 days.' Presents two options: try a new message or archive.	Warning delivered. Founder decides.
7	Reminder Engine (Day 30)	Final prompt: 'Archiving [Name] to Cold leads — you can reactivate anytime.' Auto-moves to Cold bucket. Removes from active pipeline count.	Contact archived. Pipeline count updated.

Flow B — Inbound Reply Received, Founder Has Not Responded

Step	Actor	Action / System Behaviour	Output
1	Channel Listener	Contact sends a reply on WhatsApp or email. Message captured and linked to deal card. 'Who Owns Next Move' switches to: Founder.	Inbound timer started
2	Reminder Engine (4 hours)	If founder has not replied within 4 hours: 'Quick heads up — [Name] replied to you [time ago]. Don't leave them waiting.'	WhatsApp nudge delivered
3	Reminder Engine (24 hours)	If still no founder reply: 'You're leaving [Name] hanging — it's been 24 hours. Reply now?' with 1-line summary of what they said.	Stronger nudge. Includes their message summary.
4	Channel Listener	When founder replies (detected via channel): inbound timer cancelled. 'Who Owns Next Move' switches back to Contact. Outbound timer reset.	Timers reset. No more inbound nudges.

Flow C — Pre-Meeting Brief

Step	Actor	Action / System Behaviour	Output
1	Calendar Listener	Meeting event detected with external attendee matching a known contact. Event is 24 hours away.	Pre-brief scheduled
2	AI Brief Generator	Compiles: contact name + company, deal stage + value, last conversation summary (2 lines), extracted pain point, AI-suggested meeting goal based on deal stage.	Brief document assembled
3	NoSheheet → Founder (T-24h)	WhatsApp: 'Tomorrow: Meeting with [Name] at [time]. Here's your brief: [deal context summary]. Reply 'brief' to see full details.'	Advance notification sent
4	NoSheheet → Founder (T-1h)	WhatsApp: Full formatted brief. Includes all fields. 'Reply 'done' after the call to log a note.'	Full brief delivered 1 hour before
5	Post-Meeting (if no recording)	30 min after event end time: 'How did your meeting with [Name] go? Add a quick note?' → Founder can reply in WhatsApp. Note auto-added to deal card.	Post-meeting note captured via WhatsApp
6	Post-Meeting (if recorded)	Call recording processed. AI summary auto-generated and posted to deal card. Reminder Engine recalibrated based on meeting outcomes extracted from transcript.	Deal card updated automatically. No manual input required.

Flow D — Snooze Escalation (3-Strike Rule)

Snooze #	System Behaviour
Snooze 1	Reminder rescheduled as requested. No change in tone.
Snooze 2	Reminder rescheduled. Tone slightly elevated: 'This is the second time this has been pushed — just checking in.'
Snooze 3	Final snooze allowed. System prompts: 'You've snoozed this 3 times. Should I archive [Name] or would you like to set a specific date to follow up?'
Snooze 4+	No further snoozes allowed for this deal. Founder must explicitly choose: Follow-up date, Archive, or Mark Won/Lost. Prevents indefinite limbo deals cluttering the pipeline.

Feature 3 — WhatsApp AI Sales Agent: The 'Commander' Interface

The Commander Interface is NoSheheet's WhatsApp-native AI agent — the founder's single point of control for their entire pipeline, accessible from the channel they already live in. No app to open, no context switch required. The founder queries, commands, and updates their CRM entirely through natural language WhatsApp messages.

Query Type	Example Message	Bot Response
Contact lookup	'What's happening with Priya?'	Full deal card summary for Priya

Pipeline status	'How many deals in proposal?'	Count + list + total value
Action items	'What's due today?'	Sorted list of today's follow-ups and meetings
Meeting prep	'Brief me on my 3pm call'	Pre-meeting brief: company, stage, last convo summary, their pain, your goal
Add a note	'Note for Priya: on leave till April'	Adds note to deal card, sends confirmation
Update stage	'Move Priya to Negotiation'	Updates stage, confirms, adjusts reminder cadence
Cold leads	'Who's gone cold?'	List of deals with 14+ days no activity

Chatbot rules: all responses formatted for WhatsApp readability. If query is ambiguous → bot asks one clarifying question (never two). If contact name matches multiple records → bot shows numbered list, founder replies with number.

Feature 4 — AI-Structured Deal Cards

For every contact/deal, NoSheheet maintains a living deal card that auto-populates from conversations. The card is structured across 5 sections:

Section	Fields	Auto or Manual?
Who + How to Reach	Name, email, phone, company, role, LinkedIn URL	Auto-extracted from email signature / WhatsApp; editable
Where Are We?	Deal stage, expected close date, deal value	Stage: AI-suggested based on conversation keywords → founder confirms. Date/value: manual with AI prompt.
Last Touch + Next Step	Last conversation date, AI summary, next action, due date, who owns next move	Fully auto-updated after every new message or call. Regenerated each time.
Why They'll Buy	Pain point, decision-maker status, current solution/competitor, timeline urgency	AI-extracted from conversation text; founder confirms or edits.
How They Found You	Source channel, date of first contact	Auto-detected from ingestion channel. Default: 'Unknown'.

Deal stage auto-suggestion logic: AI detects keywords ('pricing', 'proposal', 'let's go', 'signed') in any conversation and sends a WhatsApp confirmation prompt to the founder before updating the stage.

Feature 5 — Call / Meeting Recording + Auto-Summarisation

With explicit user permission, NoSheheet auto-records calls/meetings (phone calls via app, video meetings via calendar integration), transcribes them, and generates structured summaries that feed directly into the deal card.

Rule	Logic
Recording permission	Must be granted explicitly during onboarding. Can be toggled per-call. Recording indicator always shown to all participants.

Auto-detect meeting	If calendar event has external attendee matching a contact → prompt: 'Record this meeting?'
Summary structure	(1) Key points discussed. (2) Commitments made by each side. (3) Suggested next action.
Auto-update deal card	After every recorded call: last conversation summary refreshed, pain point field updated if new info detected, next action suggested.
Storage	Recordings stored 90 days (MVP). Transcripts stored indefinitely. Founder can download or delete any recording.

Feature 6 — AI Chatbot (WhatsApp-Native)

The founder can query their entire CRM via WhatsApp natural language messages at any time — no app to open.

Query Type	Example Message	Bot Response
Contact lookup	'What's happening with Priya?'	Full deal card summary for Priya
Pipeline status	'How many deals in proposal?'	Count + list + total value
Action items	'What's due today?'	Sorted list of today's follow-ups and meetings
Meeting prep	'Brief me on my 3pm call'	Pre-meeting brief: company, stage, last convo summary, their pain, your goal
Add a note	'Note for Priya: on leave till April'	Adds note to deal card, sends confirmation
Update stage	'Move Priya to Negotiation'	Updates stage, confirms, adjusts reminder cadence
Cold leads	'Who's gone cold?'	List of deals with 14+ days no activity

Chatbot rules: all responses formatted for WhatsApp readability. If query is ambiguous → bot asks one clarifying question (never two). If contact name matches multiple records → bot shows numbered list, founder replies with number.

Note: The Founder Dashboard is the presentation layer of NoSheet — it surfaces and organises data captured by Features 1–4 (Channel Integration Hub, Reminder & Follow-Up Engine, Call Recording, and the WhatsApp AI Sales Agent) rather than generating data of its own. For this reason, it is not counted as a standalone feature in the priority order and is not independently scoped in the MVP feature list. The Dashboard ships as a direct output of the core feature set being functional — when the data exists, the Dashboard renders it.

13. Moonshot Idea — Ghost CRM

The CRM that doesn't exist as a separate app.

There is no tab to open, no app to switch to, no login to remember. NoSheheet lives entirely inside the founder's existing channels:

- A WhatsApp contact the founder chats with to query or update any deal, at any time.
- A Gmail sidebar that surfaces deal context as the founder types a reply — showing who this person is, where the deal stands, and what the recommended next action is.
- A calendar overlay that sends a full pre-meeting brief before every meeting with a known contact.

The founder never 'opens the CRM.' The CRM comes to them, in the channel they're already in, at the moment they need it. Every interaction across channels is silently observed, structured, and acted upon. The founder's only job is to sell. NoSheheet does the rest.

14. High-Level Product Flow

14.1 Onboarding Flow (Target: Under 5 Minutes)

Step	Time	What Happens
1	30 sec	Sign up with Google Workspace email OR WhatsApp Business phone. Name and profile photo auto-pulled.
2	60 sec	Basic profile: Company name, Role, Industry (dropdown). No mandatory fields except name + one contact method.
3	30 sec	Permissions: Record calls, Access calendar, Location for timezone. All toggles default OFF. Skip option available.
4	90 sec	Connect channels: Gmail (OAuth), WhatsApp Business (QR scan), Google Calendar (OAuth). Optional: Notion/Sheets import. Minimum to proceed: 1 channel + Calendar.
5	60 sec	AI scans imported data. Shows proposed structure: 'I found X contacts. Here's how I organised them.' Founder reviews, makes quick edits, confirms. CRM is live.

Total onboarding: approximately 5 minutes. Zero required fields beyond name + one contact method.

14.2 Daily Usage Flow

6. Founder receives a WhatsApp morning digest: 'Today: 3 follow-ups due, 1 demo at 3pm, 2 deals going cold.'
7. Taps into NoSheheet web dashboard. Scans pipeline overview (30 seconds).
8. Taps highest-priority deal → sees unified timeline of all past conversations across channels.

- 9. Sends follow-up via native WhatsApp/email (not from within NoSheet in MVP). NoSheet auto-captures the sent message.
- 10. After demo: call auto-summarised → deal card updated → next action suggested → founder confirms or edits in 10 seconds.

14.3 Follow-Up Flow (The Core Loop)

Day	NoSheet Action
0	Founder sends proposal. NoSheet captures it and sets reminder cadence automatically.
3	No reply from [Name] on your proposal. Follow up today? [Yes] [Remind Later]
7	Still no reply. Here's a follow-up template you can send: [template tailored to deal context]
14	This deal may be going cold. Want to try a different angle or archive?
30	Archiving [Name] to Cold leads. You can reactivate anytime.

15. MVP Scope Definition

15.1 In Scope for MVP (v1)

Feature	Scope
Channel integration	Gmail + WhatsApp Business + Google Calendar
Deal cards	Auto-populated from conversations. Manual override. All 5 information sections.
Smart field visibility	Stage-based hide/show rules. Empty field suppression. Stale field flagging.
Reminder engine	Auto-cadence (3–7–14–30 day escalation). Pre-meeting briefs. WhatsApp delivery.
Dashboard	Web dashboard: pipeline kanban + today's actions + weekly snapshot. Colour-coded activity heat.
WhatsApp AI Sales Agent	Contact lookup, pipeline status, today's tasks, add notes, update stages — all via natural language WhatsApp messages.
Call recording	Manual trigger (tap to record). Auto-transcription + structured summary → auto-feeds deal card.
AI features	Conversation summarisation, stage suggestion (founder confirms), next action suggestion, pain point extraction from conversation text.
Onboarding	Google sign-up + WhatsApp link + Gmail OAuth + Calendar OAuth. AI auto-structures imported data. Target: < 5 minutes to first value.

15.2 Explicitly Out of Scope (v2+)

Feature	Reason for Deferral
LinkedIn DM sync	Chrome extension complexity + LinkedIn TOS risk
Instagram DM sync	Lower priority; secondary research confirms Meta ads are the lead source, not DMs in primary research
Sending messages from CRM	Read-only ingestion first. Sending adds channel TOS risk and support complexity.
Team / multi-user features	MVP is single founder. Multi-user arrives when founder hires first salesperson.
Outlook integration	Gmail covers the majority of early-stage startup use in the target segment.
Revenue forecasting	Requires sufficient historical data. Too early to produce reliable forecasts in MVP.
Custom pipeline stages	Default 6-stage pipeline covers all 5 primary personas. Customisation deferred to v2.
Auto-recording of all calls	MVP = manual trigger. Auto-record requires more complex consent management workflows.
Notion/Sheets live sync	One-time import is MVP. Ongoing live sync adds complexity and error states.

15.3 MVP Validation Plan

- Onboarding: can a new founder connect Gmail + WhatsApp and see their first deal card in under 5 minutes?
- Capture: does NoSheeet correctly tag inbound emails and WhatsApp messages to the right contacts within 30 seconds?
- Reminders: do reminder notifications arrive via WhatsApp at the correct cadence without manual setup?
- Dashboard: can a founder answer 'who should I follow up with today?' from the dashboard in under 10 seconds?
- Trust: after 2 weeks of use, does the founder trust the deal card data enough to use it before a call (rather than reconstructing from memory)?

16. Trade-offs and Limitations

16.1 Known Trade-offs

Trade-off	Decision	Rationale
Read-only vs. send from CRM	Read-only in MVP	Reduces integration complexity significantly. Avoids channel TOS violations. Founders already send from native apps — they need the tracking, not a new sending interface.

WhatsApp-first vs. app-first	WhatsApp-first for reminders/queries; web for full dashboard	Founders already live in WhatsApp. Adding another mandatory app creates the friction we are trying to eliminate.
AI auto-fill vs. manual confirm	AI suggests, founder confirms	Fully automatic AI actions break trust on Day 1 when errors occur. Confirm-to-accept builds confidence while keeping effort near zero.
Single-user vs. multi-user	Single-user MVP	The majority of deals at early-stage startups (< \$1M ARR) are closed by the founder alone. Multi-user is a scaling feature, not a launch requirement.
Free vs. paid	Free up to 50 contacts; paid beyond	Reduces onboarding friction to zero. 50 contacts covers the early Discovery phase for most personas in the research cohort.

16.2 What NoSheet Does NOT Solve (MVP)

- Marketing automation or lead generation — NoSheet begins at first contact, not top-of-funnel.
- High-volume B2B enterprise deal management — not designed for 50-person sales teams or complex multi-stakeholder deals.
- LinkedIn DM capture — deferred due to API constraints. Founders relying primarily on LinkedIn outreach will not get native capture in v1.
- Revenue forecasting accuracy — MVP collects the data foundation; forecasting requires 2–3 months of pipeline history to be reliable.

16.3 Dependency Risks

- WhatsApp Business API costs: if Meta changes pricing or terms, WhatsApp integration costs may increase or become unavailable for lower pricing tiers.
- Gmail OAuth availability: Google has historically maintained broad API access for CRM tools but has tightened scope in recent years.
- Privacy/GDPR: capturing and storing message content from private WhatsApp conversations requires explicit opt-in and clear data handling policies before any EU market launch.

17. Success Metrics & Pricing

17.1 Success Metrics

Metric	Baseline (Day 0)	30-Day Target	90-Day Target
Onboarding completion rate	~	> 70%	> 80%
Time to first deal card created	~	< 5 minutes	< 3 minutes
Reminder acknowledgment rate	~	> 50%	> 65%

Daily active usage (DAU/MAU)	~	> 30%	> 50%
WhatsApp bot queries per user/week	~	> 3	> 7
Follow-up completion rate vs. baseline	< 56% (44% abandonment)	> 65%	> 75%

17.2 Pricing Model

Designed to directly address the three most common pricing complaints from primary and secondary research: per-contact charges, add-on billing, and bait-and-switch tier escalation.

Tier	Price	What's Included
Free	₹0 / \$0	Up to 50 contacts. Gmail + Calendar integration. Deal cards. Basic reminders. WhatsApp bot (read-only). No credit card required.
Founder	₹999 / \$12 per month	Unlimited contacts. WhatsApp Business integration. Full reminder engine. Call recording + summarisation. AI deal card auto-fill. All dashboard features.
Team (v2)	₹1,999 / \$24 per user/month	All Founder features. Multi-user. Deal ownership + handoffs. Team activity log. Advanced pipeline visibility.

Pricing principles: no per-contact charge, no feature add-ons, no setup fees, no consultants required. Every feature on the Founder plan is available from day one at a flat price.
